## Hardware/Software

### iPhone 7's A10 Fusion chip

Unlike any other A-series chip, the A10 Fusion packs four cores, including two new high-efficiency cores. These sip one-fifth the power of the two high-performance cores, which means they won't drain the iPhone 7 battery anywhere near as quickly.

If you only use your smartphone for light tasks like messaging and email, the iPhone 7 will conserve power by relying on those high-efficiency cores. The high-performance cores will kick in only when you really need them for things like gaming and streaming video.

It's not all good news, though. Apple played conservative with RAM again this year, so iPhone 7 comes with only 2GB — just like iPhone 6s. You probably won't notice this too often during normal use, but at times the lack of RAM

becomes a pain in the butt.

For instance, when using multiple tabs in Safari or Google Chrome, you'll notice there's only room for one or two of them in memory. That means if you switch to a third tab, iPhone 7 must reload it from scratch. It becomes annoying if you run into this problem frequently.
